DOCUMENT-IDENTIFIER: US 6281526 B1

TITLE:

Nitride compound light emitting

device and method for

fabricating same

----- KWIC -----

Detailed Description Text - DETX (16):

It was found by the inventors' experiments that good results were obtained when any one of **nickel** (Ni), silver (Ag), titanium (Ti), aluminum (Al) and platinum (Pt), in addition to gold, was used as the host metal.

Claims Text - CLTX (3):

a first metal layer deposited on said contact region of said n-type In.sub.x Al.sub.y Ga.sub.1-x-y N layer of said stacked structure, said first metal layer containing as a major component thereof at least one element selected from the group consisting of gold (Au), nickel (Ni), silver (Ag), titanium (Ti), aluminum  $(\overline{Al})$  and platinum (Pt), and said first metal layer additionally containing at least one element component selected from the group consisting of Group IV and VI elements,

Metal thin film with ohmic contact

for light emit diodes

----- KWIC -----

Brief Summary Text - BSTX (16):

A metal thin film with a nickel (Ni) ohmic contact may be formed as several

models, such as Ni/Au, Ni/Cr/Au and Ni/Ni/Au films, even when the semiconductor

layer has a low doping concentration. However, such models have a high

specific contact resistance ranged from about

1.times.10.sup.-2 ohm-cm.sup.2 to

about 8.times.10.sup.-2 ohm-cm.sup.2. In addition, the thermal property of

such models is regrettably reduced due to a diffusion of nickel, thus forming a

poor surface morphology of a resulting metal thin film and deteriorating the

production yield of the optical devices using the metal thin film.
